

Teacher-Centered AI in Moodle

This session belongs to the track "AI and Emerging Technologies in Education".

Alex Contis and Laszlo Lukacs from NetSapiensis AB present this session at MoodleMoot Nordic 2026 in Copenhagen.

github.com/netsapiensis/MoodleMootNordic2026

The EU already describes how a person stays in charge of AI

We do not invent our own definition of teacher-centered AI. We build it on guidelines and laws from the EU.

The EU wrote ethics guidelines for AI in 2019 and a law for AI in 2024.

Both texts describe how a person oversees an AI system.

The EU has ethics guidelines and laws for AI

The European Commission published the Ethics Guidelines for Trustworthy AI in 2019.

The guidelines give advice. They are not law.

An independent High-Level Expert Group on AI wrote them for the European Commission.

The EU adopted the AI Act, Regulation (EU) 2024/1689, in 2024.

The AI Act is law. It binds all EU countries.

Recital 27 of the AI Act names the 2019 guidelines and their "seven non-binding ethical principles".

The binding rules of the AI Act always come first.

The principles "should in any case serve as a basis for the drafting of codes of conduct".

A recital explains the purpose of a law. Recital 27 is part of the AI Act, but it does not bind by itself.

The guidelines are at digital-strategy.ec.europa.eu/en/library/ethics-guidelines-trustworthy-ai.

The AI Act is at eur-lex.europa.eu/eli/reg/2024/1689/oj/eng.

The AI Act lists five abilities, and the guidelines list seven requirements

The AI Act, Article 14(4), from 2024, lists five abilities of the person who oversees the AI.

1. The person understands the limits of the AI.
1. The person knows about automation bias.
1. The person interprets the output correctly.
1. The person can override or reverse the output.
1. The person can stop the system.

The Ethics Guidelines for Trustworthy AI, from 2019, list seven requirements.

1. AI supports human agency and oversight.
1. AI is technically robust and safe.
1. AI protects privacy and governs data well.
1. AI is transparent. Transparency includes traceability.
1. AI is fair and does not discriminate.
1. AI supports societal and environmental well-being.
1. Someone is accountable for the AI.

To keep it simple, we choose three requirements that keep the teacher in charge: control, traceability and transparency.

The AI Act puts four uses of AI in education in the high-risk group

In education, AI is high-risk in four cases.

1. The AI judges what students have learned.
2. The AI decides who gets a place at a school.
3. The AI decides the level of education for a student.
4. The AI watches students for cheating in tests.

Source: AI Act, Annex III, point 3.

The school must choose the people who check the AI. These people need enough competence, training and authority for this job.

Source: AI Act, Article 26(2).

These rules apply from 2 December 2027. A change to the law in 2026 moved the date from 2 August 2026.

The AI Act text is at eur-lex.europa.eu/eli/reg/2024/1689/oj/eng.

The date change is at eur-lex.europa.eu/eli/reg/2026/1744/oj/eng.

We build teacher-centered AI on three requirements from EU law and guidelines

Control

The teacher chooses the material that the AI works with. When the AI makes a proposal, the teacher approves, changes or undoes it.

EU law

AI Act Article 14: a person can override or reverse the output. GDPR Article 22: a person can contest an automated decision.

Traceability

The system records each proposal, its evidence, who decided and what changed.

EU law

AI Act Article 12: high-risk AI records events in logs. Article 26(6): the school keeps the logs for at least six months.

Transparency

Students and teachers can see when AI is involved and which sources it used.

EU law

AI Act Article 50: people must be told when they interact with an AI system.

We look at four use cases of AI in Moodle

These use cases show how control, traceability and transparency work in a Moodle plugin.

Chat assistant for students

An assistant answers student questions in a chat. It answers from course documents that the teacher uploads. Each answer shows references to its sources.

Assessment as a conversation

An assessment tool runs an exam as a conversation, in text or by voice. The AI examiner asks questions and follow-up questions from the teacher's material. After the exam, it proposes a grade for each rubric criterion.

Report builder

A teacher asks a question in plain language. The AI drafts the report, and the teacher reviews it before it runs. The report uses only a fixed list of course data, and the question stays at the top of the report.

Content translation

A translation tool translates course content into other languages. It covers pages, quizzes, books, interactive packages and documents. The original text stays next to each translation.

The teacher decides which documents the assistant uses

- ✓ The teacher uploads course documents. The assistant uses them as the source for its answers.
- ✓ The assistant uses retrieval-augmented generation (RAG). For each question, it finds the matching parts of these documents and bases its answer on them.
- ✓ Students rate each answer with a thumb up or a thumb down. The teacher approves or rejects each rating, and this changes how the assistant answers in the future.
- ✓ The administrator writes guidelines for the assistant for the whole site. The teacher adds guidelines for each course.

The screenshot shows an uploaded document and its status, in a Swedish course.

Each answer shows its sources

- ✓ Each answer has numbered references. Each reference links to the document and the page that the text came from.
- ✓ The chat button tells students that the assistant is an AI.

The screenshot shows an answer with its references, in Swedish.

A complete record shows teachers each student's dialogue with the assistant

- ✓ Every chat is logged.
- ✓ The log shows every question and answer, with the student's name and a time stamp.
- ✓ The teacher can filter the log to show only answers that students rated.

Roll	Tidsstämpel	Meddelande	Feedback	Åtgärd
user	13/02/2025 09:11:20	Vad är ett adjektiv?		
assistant	13/02/2025 09:11:26	Ett adjektiv är en ordklass som anger en stabil eller temporär egenskap hos en referent, vilket kallas predikationsbasen. Egenskapen kan ibland innebära en relation till en eller flera andra referenter ¹. Egenskaper hos Adjektiv: Stabila och Temporära Egenskaper: De flesta adjektiv beskriver stabila egenskaper, vilket innebär att dessa egenskaper har en lång varaktighet. Vissa adjektiv kan också beskriva temporära egenskaper, som kan förändras snabbt ²³. Kongruens och Komparation: Adjektiv böjs i kongruens, vilket innebär att de anpassar sig efter genus, numerus och species hos huvudordet i nominalfrasen. De kan också kompareras, vilket innebär att de kan anta former som jämför (komparativ) och beskriver högsta grad (superlativ) av egenskapen . Funktioner: Adjektivet kan fungera som attribut i en nominalfras (exempelvis "ett klokt barn"), som predikativ (exempelvis "barnet var klokt") eller som adverbial ¹. Adjektiv är centrala i språket eftersom de ger mer information om substantiv och hjälper till att beskriva och klassificera referenter . Referens 1 Referens 2 Referens 3	Bra	✓ ✗

The screenshot shows the log view in a Swedish course. The two icons on the right approve or reject the student's rating.

The teacher configures the exam and the grading rules, and approves each grade

The teacher provides the source material. The examiner asks and grades only from this material, not from general world knowledge.

The teacher writes the rubric in Moodle's rubric tool, with up to ten criteria.

The teacher chooses the examiner's style, the time limit and the number of exchanges. The conditions lock when the first attempt exists.

No grade reaches the gradebook until a teacher approves it. The teacher can override any criterion with a written explanation.

The student is informed that an AI conducts the exam, and receives the reasoning behind each grade

The student guide tells students that the exam is a conversation with an AI examiner.

During the exam, a panel shows which rubric areas have enough evidence. The help text says that the panel is not a grade.

After approval, the student sees the final grade, the rubric level and the reasoning for each criterion, and the feedback.

The student can ask a question at any time. The student can dispute a grade within a time window. The teacher answers in writing.

Each grade links back to the student's own words

 The tool keeps the full transcript of every exam. For voice exams, it also keeps the audio.

 For each criterion, the proposed grade quotes the student's words as evidence and gives the reasoning.

 If a quote cannot be found in the transcript, the page warns the teacher.

 An audit log records every grade, override and dispute decision, with who did it and when.

The AI proposes a report plan, and the teacher accepts it

- ✓ The teacher asks a question in plain language. The AI turns it into a report plan: which data, which columns and which chart.
- ✓ The AI does not write database queries. It picks the data from built-in sources, for example completion and success scores. The plugin then creates the report.
- ✓ The teacher can change the columns, the sort order, the rows and the chart. No report is created until the teacher accepts the plan.

The screenshot shows the report designer with its sections open for editing, before the report is created.

The plugin saves every report and logs every time it uses the AI

A saved report stores the teacher's question, the report plan and the result.

The same plan and the same data always give the same report.

Every time the plugin uses the AI, the log records who asked, when, in which course and which data was used.

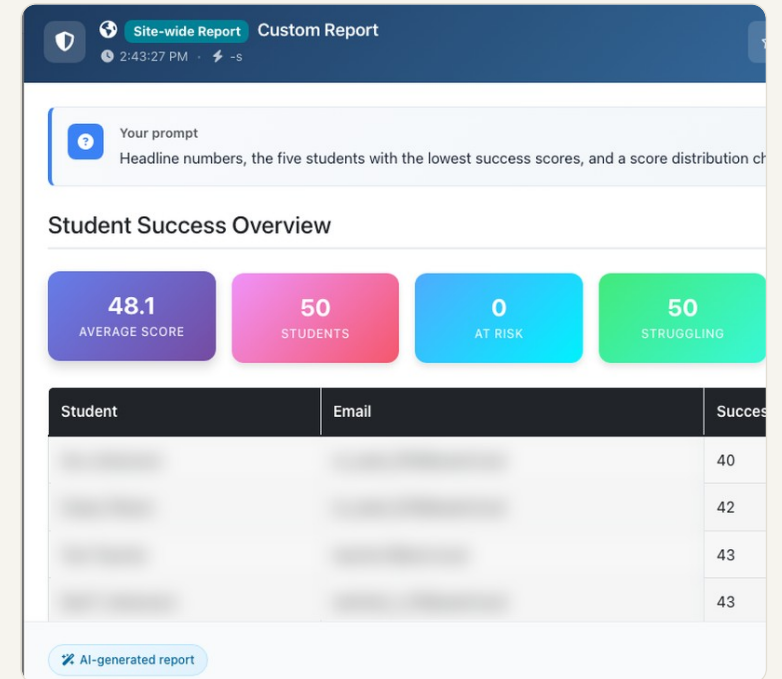

This record is kept for one year by default.

The report carries an AI label

- ✓ A report built from a question is labelled "AI-generated report" on the screen where it is read.
- ✓ The question stays with the answer. The prompt is shown above the report it produced.
- ✓ The tables and charts come from the course data. The AI writes only the short summary text.
- ✓ A chart with nothing to draw says so, instead of drawing an empty axis.

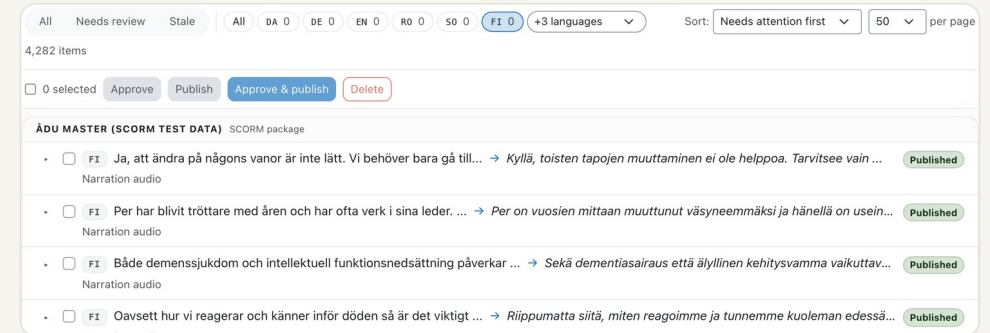

The screenshot shows a finished report with the prompt that produced it and its AI-generated label. We blurred the names and email addresses.

A person reviews and approves each translation

- ✓ The teacher chooses which content and which languages to translate.
- ✓ A person reviews each AI draft next to the original text and approves it.
- ✓ If someone edits an approved translation, it goes back to review. Only approved text is published.
- ✓ A published translation can be rolled back.

The screenshot shows the translation inbox with its Approve and Publish buttons.

Every version of a translation is kept

The history keeps every text that a translation has held.

Each version records its origin, its author, the time and the AI model.

The tool records who approved and who published each version.

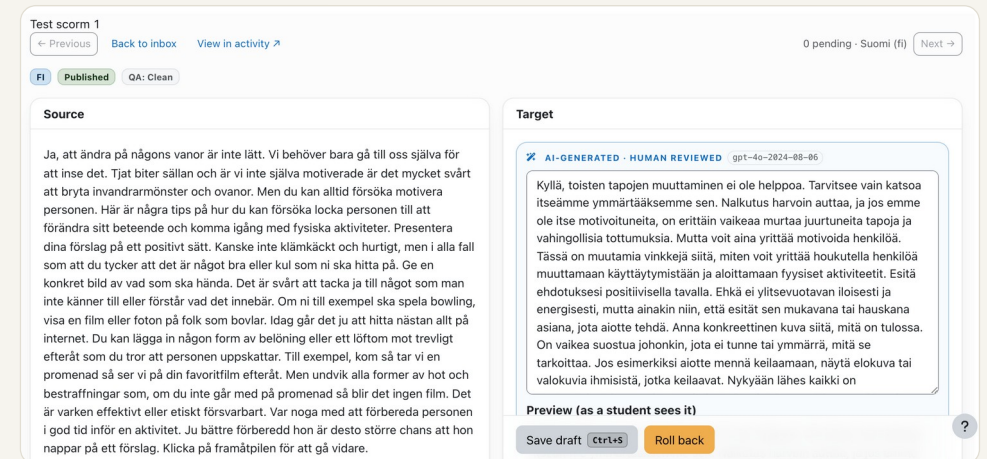

If the original text changes, the translation is marked as out of date, and the page shows what changed.

Each translation carries a label that says who reviewed it

- ✓ Each translation is labelled "AI-generated draft", "AI-generated, human reviewed" or "AI-generated, auto-published, not reviewed".
- ✓ Automatic publishing is off by default.
- ✓ Learners can see an optional "Translated (AI)" label with a link to the original text.

The review page shows the label "AI-generated, human reviewed" above the translation.

The four tools apply the three requirements in different ways

	Chat assistant for students	Assessment as a conversation	Report builder	Content translation
Control	The teacher chooses the documents and approves the ratings.	The teacher approves every grade.	The teacher reviews the drafted report before it runs.	A person approves each translation unless auto-publish is on.
Traceability	The tool logs every chat. Each answer has references.	The tool keeps the transcript and an audit log.	A saved report keeps the question, the definition and the result.	The tool keeps every version.
Transparency	Each answer shows its sources.	The student guide names the AI examiner. Each criterion shows its evidence.	Each report shows its question and an AI label.	Each translation carries an AI label.

These ideas are already built

Everything in this talk is built into four products, as Moodle plugins.

The three requirements (control, traceability and transparency) are part of each product.

Four products contain these ideas

The chat assistant for students is called **Teacher Assistant**.

Assessment as a conversation is called **AI Assessment**.

The report builder is part of **Sentinel**.

Content translation is called **Multilingual Manager**.
